

# Mapping Objects to External DBMSs

There are many decisions to be made when mapping objects to external (non-object) DBMS products. The mapping capabilities of the object storage products factor into these decisions. The tables in this section cover mapping direction, mapping generation, SQL support, and the details about table-to-class mappings and class-to-table mappings. The data here is critical to your decisions about accessing external (or legacy) data and bringing it into an object environment.
